Negative Stock Restrictions

Version 1.2

Negative Stock Restrictions Instructions

We will be moving forward with restricting POS from pushing stock into negative. This process change will have several impacts on store operations which we will need to be aware of as we make this change to each store.

1. Stock that has not yet been received into the system will not be able to be sold.
 - a. Please ensure stock is received into the system before been put out for sale or into your storeroom.
 - b. Please ensure you are accurately checking and receiving stock, this will also reduce emails from our accounts team related to supplier invoice entry at your store.
 - c. Please ensure enough people in your team have the experience and authorization to receive stock so that if managers are away someone is available to complete this task.
2. If you wish to sell an item that is split from a kit you will need to complete an adjustment to split the kit prior to selling the item.
 - a. Please ensure that you have enough staff in your team that can competently complete this task so that if a manager/s are away this task can still be completed.
 - b. This applies to color corrections as well
3. Stock that is allocated to older orders will not be able to be sold out to new orders.
 - a. This will prevent stock been used for new orders and force stores to check the old orders and ship stock or cancel if required.
 - b. Prevent stock for web sales been sold to more recent store orders (this seems to be happening a bit)
 - c. As a matter of urgency please go through your old customer orders (you get a report every day for your store emailed). Cancel those without funds attached, contact customers for stock that needs to be collected, ship stock for orders that need to be shipped. (Ensure these old orders were not already supplied but not sold out particularly important when looking at orders from back in August and September last year)
4. When you add an item that we do not have in stock to a document in POS it will automatically put it on back order as it can not go into negative. Back ordered items can not be placed against a CASH account so you will need to create a quote to add these items to work out package deals etc.
 - a. This is a good practice to get into anyway as the quote can be held against the customer record for follow up down the track.

b. If at the end of working out prices etc and the customer does not want to receive a full quote you can just cancel the order in POS and it will be removed from the system.

As discussed we are not removing the ability to go into negative for Xi users at this stage, just POS.

1. If you have a situation where you don't know where an item has come from and you need to sell it out you can take full payment as a back order in POS and then sale the order out in XI.

2. If you have a need to transfer in an item that is for a specific recent order but there are older customer orders you can dispatch this order through XI using the stock that has just arrived (NOTE – This is fully audited and any instances of taking stock from normal supplier order receipts and applying them to more recent orders while old orders are left waiting will be followed up by the head office team)

Please do everything you can to ensure that your stock file and customer order file is as clean as possible before this change over. We believe this change will be incredibly beneficial for accuracy but is also balanced with a managers ability to override when absolutely necessary.

If you have any questions regarding this please let Rory, Gregor or I know
